

### Heating Blanket for tip with silicone surface

#### Features:

- Built-in thermostat
- Light weight
- Thermal insulated
- Different sizes
- Different power
- Flexible material
- Quality assured
- Dedicated design
- Cost effective
- Express delivery

NWC heating blankets for tip, are specially designed for curing the leading and trailing tip of wind turbine blades.

These heating blankets operate at a stable temperature of approximately 60°C, when mounted correctly on the blade tip. Once the tip has been cured, ground and polished, it is possible to carry out any required procedures with no risk of grinding non-cured material and thus releasing hazardous substances into the atmosphere.
